

DIY MODELS

FORWARD HO!

These instructions show how to build an ATA sized travel case for model railroad rolling stock. The intent is to be able to travel and take railroad models via air travel for shows etc. Always check the current measurements at the ATA web site to see if sizes have changed. This is a durable wood case. I originally designed and used mine for travel from Burbank to Washington state. Be careful to be below the specific carrier's weight limits for overcharges. Also a front closure technique other than the 1-1/4" x #6 deck screws may be more convenient for security inspection.
